

PR4 / PR5 Handoff Status

Refreshed: 2026-05-12

Authoritative source plan: `.cursor/plans/tom_multi_stage_outbound_9c4e2b1a.plan.md`

Purpose: reflect the actual repo state after the later PR4, PR4.5, optional PR4, and PR5 commits landed.

Current State

- Main plan remains `.cursor/plans/tom_multi_stage_outbound_9c4e2b1a.plan.md`.
- PR4 core implementation is present in code through slices 1-5.
- PR4.5 stop/dismiss and audit behavior is present in code.
- Optional PR4 import/API lead context population is present in code.
- PR5 per-lead message overrides are present in code.
- Recent implementation commits: `09693a8`, `0307955`, `d13e8ab`, `8c5d146`, `4bc6f2e`, `2712a87`, `7db6bcb`.
- The main item not proven by repo evidence is the manual/staging gate: `pr3_synthetic_run` and `pr3_acceptance`.

Where We Are Up To

Phase	Status	Notes
Phase 0	Pending gate	<code>pr3_synthetic_run</code> and <code>pr3_acceptance</code> are still the manual/staging checks not proven by repo artifacts.
Phase 1	Done	Schema + normalizer + policy + unit/canary tests landed.
Phase 2	Done	Queue read + dial payload overlay + merge-order canary landed.
Phase 3	Done	<code>outboundDialMode</code> stamping and dedupe freeze logic landed.
Phase 4	Done	<code>validateOutboundSequenceConfig</code> optional keys + webhook <code>qual._importContext</code> behavior landed.
Phase 5	Done	Dashboard unified filters + server predicates landed.
Phase 6 / PR4.5	Done	Admin stop + dismiss + <code>_opsAudit</code> + UI/API landed.
Optional PR4	Done	Import/API population of <code>lead_dial_context_json</code> landed.
PR5	Done	Per-lead <code>firstMessage</code> / <code>systemMessage</code> overrides landed.

Exactly What Landed

Slice 1

- Added nullable `leads.lead_dial_context_json` in Postgres and SQLite migrations.
- Added `lib/lead-dial-context.js` with reserved-key stripping and size validation.
- Added intent row `dial.lead-dial-context-contained` plus policy allow-list.
- Added unit test and first canary.

Slice 2

- `lib/server-queue-workers.js` now selects `lead_dial_context_json` on the queue path and normalizes it before dialing.
- `lib/instant-calling.js` now takes explicit `leadDialContext` and applies it as the final shallow `assistantOverrides.variableValues` overlay.
- `normalizeLeadDialContext()` now strips reserved keys, keeps scalar values only, and drops oversize payloads.
- Added merge-order coverage in unit tests and a payload-capture canary `tests/canaries/lead-outbound-context-merge.canary.test.js`.

Slice 3

- Outbound enqueue sites stamp `call_data.outboundDialMode`.
- `db/domains/call-queue.js` merges dedupe mode with the locked truth table.
- Canary coverage proves no downgrade from `sequence` to `classic`.

Slice 4

- `lib/outbound-sequence.js` validates `handoffImportContextKeys` and `classicFollowUpCutoverDate`.
- `lib/vapi-webhooks/outbound-sequence-webhook.js` writes bounded `qual._importContext` from allowed keys only.
- Intent and canary coverage landed for handoff import-context behavior.

Slice 5

- Shared dashboard cohort logic landed in `lib/dashboard-follow-up-filters.js`.
- Route wiring landed in `routes/follow-up-queue.js`, `routes/lead-handoff.js`, and `routes/outbound-sequence-visibility-mount.js`.
- Unified cohort filter UI landed in `public/client-dashboard.html`.

PR4.5

- Admin/operator stop and salvage dismiss logic landed in `lib/outbound-sequence-ops.js`.
- API routes landed in `routes/client-ops-mount.js`.

- `_opsAudit` , `_salvageDismissedAt` , and `_salvageDismissedBy` behavior is covered by canary tests.

Optional PR4 And PR5

- Import/API paths now persist sanitized `lead_dial_context_json` .
- Lead message-override support now applies per-lead `firstMessage` and `systemMessage` after sequence and A/B merges.

Resume Point Now

1. There is no unfinished repo implementation slice left from the original PR4 plan.
2. Verify whether `pr3_synthetic_run` and `pr3_acceptance` were actually executed on staging.
3. If not, run that staging/manual sign-off and record the result.
4. If yes, define the next product scope beyond PR5 rather than reopening old PR4 slices.

Most Important Remaining Check

- The only plan item not evidenced in the repo is the manual/staging gate.
- Check whether `pr3_synthetic_run` was completed.
- Check whether `pr3_acceptance` was completed.
- Check whether the staging sign-off checklist in the main plan was actually executed.

Copied Plan Excerpt: Execution Phases

Phase	Contents	Blocked until
0	Complete <code>pr3_synthetic_run</code> + <code>pr3_acceptance</code> on staging	PR4 merge to <code>main</code>
1	Schema <code>lead_dial_context_json</code> + policy allowlist + normalizer skeleton + unit tests	-
2	<code>processVapiCallFromQueue</code> SELECT + wire into <code>callLeadInstantly</code> ; merge overlay + tests	Phase 1
3	<code>outboundDialMode</code> stamp all enqueue paths + <code>call-queue</code> dedupe rule + canary	Phase 2
4	<code>validateOutboundSequenceConfig</code> optional keys + <code>_importContext</code> builder in webhook + INTENT/canary	Phase 2
5	Dashboard unified filters + server predicates + copy	Phases 2-4
6	PR4.5 admin stop + dismiss + <code>_opsAudit</code> + routes + UI	Phase 3 minimum

Copied Plan Excerpt: Definition Of Done

1. Schema: `leads.lead_dial_context_json` exists and queue-path reads include it.
2. Dial path: normalized JSON merges as `variableValues` only, after sequence and after A/B merge.
3. Normalizer: `lib/lead-dial-context.js` with reserved key stripping, size cap, and no tenant-key leak in merged vars.
4. Queue snapshot: enqueue paths stamp `outboundDialMode` ; dedupe merges mode per locked truth table.
5. Tenant JSON: `validateOutboundSequenceConfig` accepts `handoffImportContextKeys` and `classicFollowUpCutoverDate` .
6. Handoffs: completed or abandoned sequence writes bounded `qual._importContext` from an allow-list only.
7. INTENT + policy + canaries cover merge order, tenant-key safety, dial-mode freeze, and bounded import context.
8. Dashboard filters and server predicates match the agreed cohort logic.
9. PR4.5 adds admin-only stop + dismiss + bounded `qual._opsAudit` .
10. `npm run test:ci` is green.

Copied Plan Excerpt: Locked Dedupe Truth Table

Existing	Incoming	Result
sequence	any	sequence (never downgrade)
classic	sequence	sequence
classic	classic or null	classic
null	sequence	sequence
null	classic	classic
null	null	null (infer at dial)

Copied Plan Excerpt: PR Slice Order

1. Schema + normalizer + policy allowlist + unit tests.
2. `processVapiCallFromQueue` + `callLeadInstantly` overlay + merge-order canary.
3. `outboundDialMode` all enqueue sites + dedupe merge + freeze canaries.
4. Webhook `_importContext` + INTENT rows for handoff/import bounds.
5. Dashboard filters.
6. PR4.5 stop / dismiss / `_opsAudit` .

Updated Short Checklist

- Open `.cursor/plans/tom_multi_stage_outbound_9c4e2b1a.plan.md` and this handoff file.
- Treat PR4 / PR4.5 code implementation as complete in-repo.
- Verify whether the staging/manual acceptance gate was completed outside the repo.
- If the staging gate is already done, define the next scope after PR5 instead of reopening old slices.

This document is a handoff copy for convenience. The authoritative evolving plan remains `.cursor/plans/tom_multi_stage_outbound_9c4e2b1a.plan.md` .
